INTRODUCTION TO CYBER SECURITY REPORT

Introduction

In this report, I cover what I learned from the TryHackMe Introduction to Cyber Security module. Through a mix of explanations and practical labs, I was able to understand how cyber security applies to real-world systems and web applications.

Introduction to Cyber Security

I learnt about two types of security namely Offensive Security and Defensive security each of which I studied more in the next sections of the module.

Offensive Security Intro

In this section, I was introduced to offensive security, which focuses on thinking like an attacker to identify vulnerabilities before malicious hackers exploit them.

I practiced this by hacking a simulated banking website in a safe environment. Using directory brute-forcing with Dirb, I discovered hidden pages, including an exposed admin panel. Exploiting this misconfiguration allowed me to add money to an account.

Question: What is the bank account number in the FakeBank application?

Answer: **8881**

Question: What is the other hidden URL?

Answer: I opened the terminal and used the command **dirb** <http://fakebank.thm> to find the other hidden URL.

Question: When your balance turns positive, a pop-up with green text appears. Enter the green words as the answer.

Answer: I found the admin panel for adding money to an account and added money to mine.

Defensive Security Intro

In this section, I learned how organizations protect their systems and data from cyber attacks. This involved understanding how security teams monitor networks, detect suspicious activity, and respond to incidents before they cause serious damage. I was introduced to the role of Security Operations Centers (SOCs) and how tools like SIEM are used to collect and analyze logs from different systems to identify potential threats.

I also learned about the importance of defence in depth, where multiple layers of security are used to reduce the impact of an attack if one layer fails. Overall, this section helped me understand how defensive security focuses on prevention, detection, and response to maintain the security of an organization.

Question: What is defensive security also known as?

Answer: **Blue Teaming.**

The screenshot shows the TryHackMe 'Defensive Security Intro' room interface. At the top, the browser address bar shows 'tryhackme.com/room/defensivesecurityintro'. The room progress is 25%. The interface is divided into several sections:

- British Airways (2018):** Personal details such as birth names, addresses, and payment card details of 400,000+ customers were leaked. British Airways was fined £20 million for this incident.
- Marriott International (2020):** The passport information, payment card details, and names of 334 million customers were leaked, partly due to outdated systems. Marriott International settled a \$52 million lawsuit.
- Advanced Computer Software Group (2022):** Medical records and phone numbers for 79,904 people were leaked due to weak security policies. Government officials fined the organisation £3.07 million.
- 23andMe (2023):** Over 7 million users' sensitive data, such as names, addresses, health records, and DNA data, were leaked due to poor security policies. 23andMe was fined £2.31 million by government officials.

On the right side, there are two achievement boxes:

- 33/472 Points earned!** Levelling up in progress...
- 40/472 Points Earned!** Levelling up in progress...

Below the information cards, there is a section titled 'Answer the questions below' with the question: 'What is defensive security also known as?'. The answer 'Blue Teaming' is entered in the text box, and a green button indicates 'Correct Answer'.

At the bottom, there are four tasks listed:

- Task 2: Responsibilities of Defensive Security
- Task 3: Defensive Security in Practice
- Task 4: Practical: Defend FakeBank

The Windows taskbar is visible at the bottom of the screen, showing various application icons and the system clock indicating 10:43 on 26/01/2026.

Question: An attack has been detected in an organisation's network. What is the name of the person above who would be responsible for responding to the attack?

Answer: **Aaliyah**. She is the Incident Responder and thus has the responsibility to respond to ongoing security incidents.

Question: This action will open a “static site” on the right side of you screen. Investigate the “Web Discovery Attack” and perform the necessary, guided, protective measures to stop it from continuing. What is the flag that you obtained by following along?

Solution:

I started by blocking the Source IP Address.

I then implemented security actions and the rate limit.

Lastly I updated the WAF rules to block other suspicious enumeration attempts.

The answer was **THM{FAKEBANK-SECURED}**

Careers in Cyber

I learned that cyber security offers a wide range of career paths, from offensive roles like penetration testing to defensive roles such as security analysis and security engineering. I learned that you don't need a specific background to enter the field, as curiosity, problem-solving, and an interest in how systems work are key skills. The section also highlighted roles like security analysts, who monitor and investigate threats, security engineers, who design and maintain protective systems, and penetration testers, who ethically hack systems to find vulnerabilities. Overall, cyber security is a high-demand field with strong career progression and constant learning opportunities.

According to the interactive quiz my ideal cyber security role would be a **Security Analyst**.

Conclusion

This module provided a solid introduction to the fundamentals of cyber security by covering both offensive and defensive concepts. The labs made the learning more practical and showed

how common weaknesses can be identified, exploited, and defended against in real-world scenarios. It also provided a strong base for progressing into more advanced topics such as web application security, vulnerability analysis, and penetration testing.
